Zipper

The Owners' Guide to the CRM

This book explains how to run the Zipper business from the CRM.

It is written in plain English. Every part is short. You do not need to read it all at once — read Part 1 and Part 4 first, then use the rest when you need it.

Who this is for

The three business owners of Zipper.

In the CRM your job title is **Super Admin**. That is the highest level. You can see everything and you are the only people who can approve money.

The one thing to remember

Money never moves unless an owner says so.

Staff can prepare and check things. Only you can approve. And even after you approve, one more click is needed before money actually leaves. Part 4 explains this properly.

Website: **https://zipperlive.web.app**

Version 1 · August 2026

What is in this book

Part 1 · The basics

What the CRM is
The words you need to know
Who is who

Part 2 · Getting in

Signing in the first time
Your three security questions
Signing in after that
If you forget your password
The fourth person: the Observer

Part 3 · Finding your way around

The menu on the left
Start here every day

Part 4 · The Money Board — your main job

What a card is
The five steps money goes through
How to sign a card
How to make the money actually move
How to refuse a card
The rules that protect you
Signing many cards at once
When a card says Failed

Part 5 · The different kinds of money

Paying an agency
A coin seller pays us
Lending to a seller
A host taking money out
A seller selling to a customer
Changing a user's balance

Part 6 · New agencies and sellers

How they join
Checking their documents
Approving and refusing
Sub-agencies
One person, two businesses

Part 7 · Commission — how agencies get paid

How it works
The rate tables
The floor
Sunday night
Paying the commission out

Part 8 · The money screens
Finance overview
Cash position
Liabilities
Payouts
Withdrawals
Profit
Credit book

Part 9 · Watching the business
The weekly report
Alerts
The audit log

Part 10 · Other things you can do
Staff and who can see what
Sending email
Live monitor
The approvals queue

Part 11 · Six traps — read this part twice

Part 12 · Your routine
Every day
Every Monday
Every month
When something looks wrong

Part 13 · What is not finished yet

PART 1

The basics

1.1 What the CRM is

The CRM is a website. You open it in a browser, on a computer or a phone.

It is the office of the business. The app that customers use is a different thing. The CRM is where you and your staff run everything behind the app:

- who your agencies and coin sellers are
- how much money came in and went out
- who is owed what
- and every approval you give

Nothing in the CRM is a guess. Every number comes from a record. Every action is saved with your name, the time, and the reason you typed.

> **The CRM keeps two separate things**
>
> **The record of money** — this is the truth. It cannot be edited or deleted by anybody, including you.
>
> **The app's own data** — profiles, pictures, live rooms. This is a copy for the app to read.
>
> If the two ever disagree, the money record is right. The CRM will tell you on screen when this happens.

1.2 The words you need to know

Learn these ten words. Everything else in this book uses them.

Word	What it means
Diamonds	What a customer buys with real money. Customers spend diamonds on gifts inside the app.
Beans	What a host earns when someone sends them a gift. Beans are turned into real money when the host cashes out.
Host	A person who goes live in the app and earns beans. Also called a streamer.

Word	What it means
Agency	A company or person who brings hosts to us and looks after them. We pay them commission.
Sub-agency	A smaller agency working under a main agency. We pay the main agency, and the main agency pays them.
Coin seller	A person who buys diamonds from us in bulk and sells them on to customers. Also called a reseller.
Commission	The money we pay an agency for the business their hosts brought in.
Card	One request to move money. Every single payment in the business is a card. Part 4 explains cards.
KYC	Checking someone's identity documents before we do business with them — Aadhaar, PAN, bank passbook.
UTR	The reference number a bank gives a transfer. It is how we prove a payment really happened.

> **How money flows through the business**
>
> A customer pays real money and gets **diamonds**.
>
> The customer sends a gift to a host. The host receives **beans**.
>
> The host cashes out their beans and we pay them real money.
>
> The **agency** that brought that host earns **commission** on what their hosts cashed out.
>
> **Coin sellers** sit at the front of this: they pay us cash in bulk, and sell diamonds on to customers themselves.

1.3 Who is who

Everybody who uses the CRM has one job title. The title decides what they can see and what they can do.

Title	What they are
Super Admin	A business owner. That is you. Sees everything. The only person who can approve money.
Observer	A fourth person who can see the whole business, including all the money, but cannot change one single thing.

Title	What they are
Team Admin	The head of a department — App, Operations, Finance, Tech, Support or Marketing. Can check money requests but can never approve one.
Team Member	A staff member in a department. Can do their daily work and raise requests.
Agency / **Coin seller**	Your partners. They log in to the same website but see only their own business.

Why there are three of you

Two people must touch every payment. One person checks it. A different person approves it.

This is not because anyone is not trusted. It is so that a mistake is caught by the second pair of eyes before the money is gone.

It also protects each of you. If a payment is ever questioned, the record shows two names, two reasons and two times.

PART 2

Getting in

2.1 Signing in the first time

Go to **https://zipperlive.web.app**

You will see a black screen with **Zipper CRM** at the top.

1. In the box marked **EMAIL**, type your email address.
2. In the box marked **PASSWORD**, type your password.
3. Click the pink button that says **Sign in**.

There is no Google button. There is no sign-up. Email and password only.

2.2 Your three security questions

Because you are an owner, the CRM asks for more than a password.

The very first time you sign in, a screen appears called **Set Your Security Gate**. It asks you three questions:

1. **Your Full Name** — for example, Soumya Ranjan Singh
2. **Your Phone Number** — for example, 8908641811
3. **Your Called Name (Nickname)** — for example, kanha

Type your three answers and click **Save & Enter CRM**.

> **Write your three answers down today**
>
> **These answers cannot be recovered by anybody.** Not by us, not by a reset link, not by another owner.
>
> If you forget them you cannot get into the CRM again on this account.
>
> Write them on paper and keep the paper somewhere safe and private. Do it the same day you set them.
>
> The phone number must be typed **exactly** the same way every time. Your name and nickname are more forgiving — capital letters and extra spaces do not matter for those two.

2.3 Signing in after that

Every time after the first, you type your email and password, and then a screen called **Identity Verification** asks the same three questions again.

Answer all three and click **Verify**.

> **You get three tries**
>
> If an answer is wrong the CRM tells you which one, and how many tries you have left.
>
> After **three wrong tries** the message is *"Too many wrong attempts. Access denied."* and you are signed out automatically.
>
> Nothing is broken and nothing is locked forever. Sign in again and answer carefully.

2.4 If you forget your password

On the sign-in screen, click the small pink words **Forgot password?**

1. Type your email address.
2. Click **Send Reset Link**.
3. Open your email and click the link. Choose a new password.
4. Come back and sign in with the new password.

This resets your **password** only. Your three security answers stay the same. Nothing can reset those.

2.5 The fourth person: the Observer

There is a fourth login called the **Observer**. It can look at the whole business, including every rupee, but it cannot change anything at all.

It works differently from yours. It has no password. Instead:

1. Go to **https://zipperlive.web.app/observer**
2. Click **Send me a sign-in code**.
3. A six-digit code is emailed. It expires in ten minutes.
4. Type the six digits and click **Sign in**.

Why the code goes to a different mailbox

The Observer signs in as **314zipper@gmail.com**, but the code is emailed to **soumyars675@gmail.com**.

That is on purpose. Somebody who gets hold of the Observer account still cannot get in, because the code arrives somewhere else.

A new code is needed every single time. There is nothing to remember and nothing to steal.

PART 3

Finding your way around

3.1 The menu on the left

Down the left side of every screen is a menu. As an owner you see all of it.

The top three are the ones you will use most:

Menu item	What it is for
Waiting on you	Everything that needs you personally. Start here.
Money Board	Every money request in the business. This is your main job.
Dashboard	A general picture of the day — users, hosts, who is live.

Below those, the menu is grouped. Click a group name to open it.

Group	What is inside
Users & Hosts	Every customer and every host.
Sellers & Agencies	Your partners, their documents, their purchases and sales.
Finance	All the money screens. Part 8 covers these.
Economy	Gift prices, bean rates, commission rates.
Chance	Lucky gifts and games. Not switched on yet.
Live & Comms	Watching live rooms right now.
Marketing	Sending emails and app messages.
Operations	Bans, reports of bad behaviour, complaints.
App Config	Settings inside the app. Owners only.
Admin	Staff access, the audit log, approvals.

3.2 Start here every day

Click **Waiting on you**. It shows three boxes:

- **To verify** — cards your team needs to check. Usually not your job.

- **To sign** — cards checked by someone else and now waiting for **you**. This is your work.
- **Yours pending** — things you asked for that are still moving.

If **To sign** shows a number, go to the Money Board and deal with it. If it shows a dash, read the next box carefully.

> **A dash is not a zero**
>
> Sometimes a box shows **—** with the words *“Could not be read — this is not zero.”*
>
> That means the CRM could not reach the record. It does **not** mean there is nothing waiting.
>
> The CRM will never show you a confident **0** that it is not sure about. This is deliberate. Nobody double-checks a zero.
>
> If you see a dash, click **Refresh**. If it stays, tell your tech team.

PART 4

The Money Board — your main job

4.1 What a card is

Every time money needs to move in this business, a **card** is made.

Paying an agency is a card. A coin seller paying us is a card. A host taking money out is a card. Lending stock to a seller is a card. Even correcting a mistake is a new card.

A card holds who asked, how much, why, who checked it, who approved it, and when the money actually moved.

> **Nothing moves money except an executed card**
>
> There is no other way. No screen anywhere lets a person move money directly. No staff member can, no partner can, and no customer can.
>
> This means that if you look after the Money Board, you are looking after the whole business.

4.2 The five steps money goes through

Open **Money Board** from the menu. At the top it says:

“Teams verify. Owners sign. Nothing moves without both.”

The board has columns. A card moves left to right through five steps.

Step	Column name	What it means
1	**Requested**	Somebody asked. Nothing has been checked yet.
2	**Under Review**	Somebody is checking it.
3	**Awaiting Sign-off**	It has been checked. It is now waiting for **you**.
4	**Approved**	You signed it. **The money has still not moved.**
5	**Executed**	The money has moved. This is the end.

There are two more columns for things that went wrong:

Column	What it means
Rejected	Somebody refused it. Nothing moved. This is final.
Failed	You signed it and the transfer did not go through. Nothing moved, but the request is still unmet. This needs a person.

Step 4 is not the end — this is the most common mistake

Approved does not mean paid.

When you sign a card it goes to **Approved**. The screen says, in plain words, *“Signed, awaiting execution. Money has not moved.”*

Somebody still has to do the last step. Until they do, the agency has not been paid and the seller has no stock.

The two steps are kept apart on purpose. If a transfer fails, the card is visibly stuck instead of quietly lost.

4.3 How to sign a card

When you open the Money Board, look for an orange strip at the top saying **“N cards waiting on your signature”**.

1. Click a card in the **Awaiting Sign-off** column. A panel opens on the right.
2. Read what the card is for, how much it is, and who asked for it.
3. Read the note the person who checked it wrote. It says what they checked.
4. If you are happy, click the green button **Sign**.
5. You may type a reason. For signing it is optional.

The card moves to **Approved**. Remember: the money has still not moved. Go to section 4.4.

Before you sign, ask yourself three things

Do I know what this payment is for? If the reason on the card does not make sense to you, do not sign it. Ask.

Did somebody else really check it? The note should say what they checked, like *“Checked the UTR against the bank statement, amount matches.”* A vague note is a reason to ask more.

Is the amount right? You are the last person who can stop it.

4.4 How to make the money actually move

This is called **executing**. Only an owner can do it.

Where you do it depends on the kind of card.

For balance cards (adding or removing a user's diamonds or beans)

1. Open the card on the **Money Board**.
2. Click the green button **Execute — move the money**.
3. A confirmation appears. Click **Yes — move [amount]**.

For everything else

Other cards are executed from their own screen, not from the board. The board tells you this when you open the card.

Kind of card	Where you execute it
Paying an agency	Open that agency's page and click **Execute**
Coin seller purchase	**Coin Purchases** screen
Lending to a seller	The seller's page
Seller sale	**Seller Sales** screen, button says **Approve**
Host withdrawal	**Withdrawals** screen, button says **Mark paid**

> **Executing cannot be undone**
>
> The moment you execute, the money is gone or the stock is issued.
>
> There is no undo button anywhere in the CRM. If a mistake is made, the only fix is a **new card** going the other way, which also has to be checked and signed.
>
> Take the extra three seconds before you click.

4.5 How to refuse a card

If something is wrong, refuse it. This is called **rejecting**.

1. Open the card.
2. Type why you are refusing it in the reason box.
3. Click **Reject**.

A reason is compulsory. The button will not work without at least a few words. That reason is saved forever, and if the card came from an agency or a seller, **they are**

shown your reason.

Write a reason they can act on. *“Amount does not match the bank statement — please resend with the correct UTR”* is useful. *“No”* is not.

Rejecting is final. Nothing moved and nothing can be un-rejected. If it turns out you were wrong, a fresh card is raised.

4.6 The rules that protect you

The CRM refuses certain things even for owners. These are not faults. They are there to keep two people on every payment.

The rule	Why
You cannot check your own card.	The message says *“You raised this card. Someone else must verify it.”*
You cannot sign a card you asked for.	*“You raised this card. Another owner must sign it.”*
You cannot sign a card you checked yourself.	*“You verified this card. Someone else must sign it.”* This is the rule that keeps two humans on every payment.
Only an owner can sign.	Team admins can check, never approve.
Only an owner can execute.	Even a signed card sits still until an owner finishes it.

> **This is why the third owner matters**
>
> Right now only **two** owner accounts exist. The third has not been set up.
>
> With two owners, if one of you raises or checks a card, the other one is the **only** person left who can sign it. If that person is travelling or ill, the payment waits.
>
> Adding the third owner fixes this. Until then, try not to raise or check cards yourselves — let the staff do that, so both of you stay free to sign.

4.7 Signing many cards at once

If there are many cards waiting, you do not have to open each one.

1. Click **Select all** in the orange strip at the top.
2. Untick anything you want to look at properly.
3. Click **Sign N cards**.

You can sign up to 100 at a time. Each one is still recorded separately with your name.

> **One catch with signing in bulk**
>
> The tick boxes automatically leave out cards **you raised**. Good.
>
> But they do **not** leave out cards **you checked yourself**. If one of those is in the batch, the CRM refuses just that one and tells you: *“12 signed. 1 refused: You verified this card. Someone else must sign it.”*
>
> Nothing is broken. That single card needs the other owner.

4.8 When a card says Failed

A red strip appears saying **“N cards failed to execute.”**

This means you signed it, the CRM tried to move the money, and it did not work.

No money moved, so nothing needs to be reversed. But the payment has not happened, and it will not fix itself.

1. Open the card and read what the server said went wrong.
2. Fix that problem — usually a bank detail or a missing reference.
3. Either raise a fresh card, or reject this one so it stops sitting there.

PART 5

The different kinds of money

Every card is one of these. You do not need to remember them all. Come back when you meet one.

5.1 Paying an agency

An agency earns commission. When we pay it, a card is raised from that agency's page.

After you sign it, go to that agency's page to execute. The CRM asks you for the **payment reference (UTR)** from the bank and will not finish without one.

That is on purpose. A payment with no reference cannot be matched against the bank statement later.

5.2 A coin seller pays us

This is the one place real money comes **into** the business.

A seller sends us money and asks for stock. Somebody in Finance checks the payment reached the bank. You sign. Then an owner clicks **Credit the inventory** on the **Coin Purchases** screen.

> **Watch for a repeated payment reference**
>
> The Coin Purchases screen checks whether the same UTR has been used before, and warns you in red:
>
> *“This reference is a duplicate. Crediting it may be paying ourselves with money we never received.”*
>
> If you see that, **stop**. Check the bank statement yourself before you sign or credit anything.

5.3 Lending to a seller

Sometimes we give a seller stock on credit. There are four cards for this:

Card	What it does
Lend	Give stock on credit. A due date is compulsory — credit with no due date is a gift.

Card	What it does
Repay	The seller has paid back. This closes the debt. No stock moves.
Recover	Take what is owed out of the seller's own balance. A late penalty can be added.
Write off	Give up on the money and book it as a loss. This is a real cost to the business.

A seller who is overdue is automatically blocked from taking more stock. The CRM refuses it, not just the screen.

5.4 A host taking money out

A host asks to cash out their beans. Go to **Finance → Withdrawals**.

It moves through three states: **pending**, then **approved**, then **paid**.

> **Approved is not paid here either**
>
> When you approve, the CRM tells you: *"The money has not moved yet — mark it paid once the transfer is done."*
>
> After you actually make the bank transfer, come back and click **Mark paid**. It asks for the UTR or a transaction reference and refuses to save without one.

5.5 A seller selling to a customer

A seller files a sale. Filing it does nothing on its own.

An owner approves it on the **Seller Sales** screen. Approving takes the stock off the seller first, and only then gives diamonds to the buyer.

That order matters: a seller who is short of stock is stopped before any diamonds are created.

If a sale shows **Failed**, it means the seller was charged and the buyer was not given anything. That value is currently nowhere and needs a correction card. Approving again will not fix it.

5.6 Changing a user's balance

Sometimes a customer's diamonds or a host's beans need correcting. That is also a card, and it is the one kind you execute directly from the Money Board.

Nobody can change a balance from any other screen. Not staff, not you.

PART 6

New agencies and sellers

6.1 How they join

There are four ways in. Two are forms the partner fills in themselves. Two are filled in by your staff.

Way in	Who does it
zipperlive.web.app/agency-signup	The agency, by themselves
zipperlive.web.app/seller-signup	The coin seller, by themselves
Agencies → Add agency	Your staff, for them
Coin Sellers → Add seller	Your staff, for them

The menu item **How partners join** shows all four with the links ready to copy and send.

A sub-agency is different. Only the main agency can create one, from inside their own dashboard. You cannot do it for them and you cannot see the form. If they are stuck, walk them through it.

6.2 Checking their documents

Go to **Sellers & Agencies → KYC**. There are four queues:

- Main agency
- Sub-agency
- Coin sellers
- Hosts

The documents are shown on screen. Click one to make it bigger. The screen says it plainly: *“verification means looking at it.”*

Who	What they send
Agency (India)	Aadhaar card, PAN card, bank passbook
Agency (outside India)	Passport, national ID, proof of address

Who	What they send
Coin seller	One government photo ID
Host (India)	Aadhaar card, PAN card, bank passbook

If there are no documents

The screen will say: *“No documents were uploaded. There is nothing here to verify against — approving would be a decision made on no evidence.”*

You can still approve, but you must write in the reason what you checked instead. Do not approve blind.

6.3 Approving and refusing

Each row has **Approve** and **Reject**. Both ask for a reason.

Approving lets them start trading. **It moves no money.** Any payment is always a separate card that an owner signs.

Rejecting stores your reason on their record and shows it to them, so they know what to fix instead of applying again and again.

Rows older than three days get an orange border. Deal with those first — a partner waiting a week is a partner going to a competitor.

6.4 Sub-agencies

Money reaches a sub-agency through its parent, never directly

We pay the **main** agency. The main agency then pays the sub-agency and confirms they did.

That is why a sub-agency payout has **two legs**. Leg one is our money leaving. Leg two is the parent confirming it was passed on.

Between the two legs, the sub-agency may not have been paid at all. The Agencies screen warns you when leg two is missing: *“N sub-agency payouts left our account and have not been confirmed passed on.”*

Chase those. That is our money sitting with somebody else.

6.5 One person, two businesses

An approved agency can also apply to become a coin seller, and the other way round. One login, two businesses.

The two are kept completely separate. Their commission and their coin stock never mix. It is a second record that starts at zero and has to be approved like any new application.

When they apply, it shows at the top of the Agencies or Coin Sellers screen. A staff member clicks **Put in the queue**, then it is approved normally.

PART 7

Commission — how agencies get paid

7.1 How it works

Commission is worked out for one agency, for one period, in three steps.

1. **Add up what their hosts cashed out** in that period, in rupees. This total is called their **billing**.
2. **Find which band that total falls into** in the table below.
3. **Apply that band's rate to the whole total.**

> **The rate applies to the WHOLE amount**
>
> This is flat by band. It is **not** like income tax.
>
> An agency that bills **₹1 crore** earns **25% of the whole ₹1 crore**.
>
> Not 25% of the part above ₹25 lakh. The whole thing.
>
> Please make sure you understand this before you agree a rate with anybody.

> **Beans that were earned but not cashed out do not count**
>
> Only beans a host has actually **taken out** count as billing.
>
> Beans sitting in a host's balance count in the period they are finally paid, not the period they were earned.

7.2 The rate tables

Main agency

Billing in the period	Commission rate
₹25,001 to ₹75,000	**5%**
₹75,001 to ₹1,50,000	**7.5%**
₹1,50,001 to ₹3,00,000	**10%**
₹3,00,001 to ₹5,00,000	**14%**
₹5,00,001 to ₹8,00,000	**16%**
₹8,00,001 to ₹12,00,000	**18%**
₹12,00,001 to ₹18,00,000	**21%**
₹18,00,001 to ₹25,00,000	**23%**
₹25,00,001 and above	**25%** (no upper limit)

Sub-agency

Billing in the period	Commission rate
₹26,001 to ₹75,000	**5%**
₹75,001 to ₹1,50,000	**6%**
₹1,50,001 to ₹3,00,000	**7%**
₹3,00,001 to ₹5,00,000	**8%**
₹5,00,001 to ₹8,00,000	**9%**
₹8,00,001 to ₹12,00,000	**10%**
₹12,00,001 to ₹18,00,000	**11%**
₹18,00,001 to ₹25,00,000	**12%**
₹25,00,001 and above	**12.5%** (no upper limit)

7.3 The floor

Below **₹25,001** for a main agency, or **₹26,001** for a sub-agency, the agency earns **nothing** for that period.

This is a real zero, not a mistake. The agency's own dashboard tells them so, and tells them how much more they need to bill to reach the first band.

> **The hosts are still paid in full**
>
> The floor applies to **agency commission only**.
>
> If an agency earns no commission this week, their hosts still receive every rupee of their own payout.
>
> Say this clearly to any agency who asks. It is the question they always ask.

7.4 Sunday night

Every **Sunday at 11:59 pm India time**, the CRM works out commission for the week that has just closed and records it.

You do not have to do anything. It happens by itself. You then get an email with the weekly report.

The subject line of that email tells you if something went wrong. Read it:

Subject line ends with	What it means
commission accrued	All good. Nothing to do.
N agency(ies) NOT accrued	Some agencies did not get worked out. Somebody needs to look.
ACTION NEEDED: commission did NOT accrue	Nothing was worked out at all. This needs attention on Monday morning.

> **The Sunday job can create a debt but can never pay one**
>
> The automatic job is only allowed to record what is owed.
>
> It has no power to pay anybody. Every payment still needs a card that an owner signs and executes.
>
> It also stops itself if a figure looks too large, or if the rate table could not be read properly. It will not create a big liability unattended at midnight.

7.5 Paying the commission out

Recording what is owed and paying it are two different things.

1. Open the agency's page from **Agencies**.

2. Look at **Outstanding** — that is what we owe them right now.
3. Click **Raise a payout**. This makes a card. Nothing has moved.
4. Somebody checks it. You sign it.
5. Come back to the agency's page, type the bank **UTR**, and click **Execute**.

PART 8

The money screens

All of these are under **Finance** in the menu. Only owners and the Finance Admin can open them.

Every one of them has a date picker at the top right and an **Export** button that downloads the figures as a spreadsheet.

8.1 Finance overview

The front page of the money. Cash in, cash out, what we owe, and how many cards are waiting. Start here, then go deeper.

8.2 Cash position

Money in, **money out**, and the difference, for the dates you pick.

> **This is real cash, not diamond value**
>
> Only money with proof — a bank reference, a UTR, a gateway record — counts as money in.
>
> Free diamonds, corrections and game winnings are counted separately and are **never** called revenue.
>
> The two figures are not the same and must never be quoted as each other.

8.3 Liabilities

What the business owes right now. This screen has no date picker, because a debt is not a period — it is a fact at this moment.

Four lines:

Line	Is it a debt?
Commission owed to agencies	**Yes** — we owe this
Beans held by hosts	**Yes** — we owe this
Coin stock held by sellers	No — already paid for
Seller credit receivable	No — this is owed **to** us

Net position in green means sellers owe us more than we owe agencies and hosts. In red it means the opposite, and that gap has to be paid for out of cash.

8.4 Payouts

What actually left the business, and the queue of weekly agency reports waiting for approval.

If a payout was signed but never executed, an orange strip at the top tells you, with how many days it has been sitting there. Those are promises we have made and not kept.

8.5 Withdrawals

Hosts asking to cash out. Covered in section 5.4.

8.6 Profit

Revenue, payouts, commission and margin.

The most useful number here is the **bean-payout ratio**: of every rupee of diamonds customers spent, how much left the business as host payouts. **Lower is better.**

> **Read Part 11 before you quote any profit figure**
>
> The number on this screen is **not** your real profit yet. It does not include the cost of running the company.
>
> Section 11.3 explains exactly why, and what to do about it.

8.7 Credit book

Every seller who owes us stock, how much, and how late they are.

Sellers who are overdue are lifted to the top in red. They are automatically blocked from taking more stock until they clear it.

Nothing on this screen moves anything. Every button raises a card that you then sign.

PART 9

Watching the business

9.1 The weekly report

Menu: **Weekly Report**. This is the single most useful screen in the CRM for an owner.

It is one full week of the business in five sections:

- **Profit and loss** — money in, money out, profit, margin
- **Money in** — recharges, seller credit given and repaid
- **Agencies** — who billed what, who earned commission, who was below the floor
- **Hosts** — who was active, who qualified for a payout
- **Leaderboards** — top hosts and top spenders

It is generated every Sunday night and emailed to you. This screen shows you the exact document that was emailed — not a fresh calculation. That means the figures cannot quietly change after the fact.

Use the arrows at the top to move between weeks. Each section has its own **Download CSV** button.

> **Red and orange strips on this screen**
>
> **“N sections could not be computed for this week”** — something failed. Those sections are shown as failures, not as zeros.
>
> **“N things on this week need a person”** — read these. They are the things the CRM has noticed and cannot fix by itself.
>
> **“This profit is an upper bound”** — see Part 11.

9.2 Alerts

Menu: **Alerts**. Everything the CRM watches for, and what is wrong right now.

Four counters at the top. The important one to understand is **“Checks that did not run”**.

A check that did not run is **not** a check that passed. Each one is listed with the reason.

When a problem has been dealt with, an owner can click **Clear** on it. That does not fix anything — it just lets the CRM alert you again if it comes back. Clear it *after* dealing with the problem, never instead of dealing with it.

9.3 The audit log

Menu: **Admin → Audit Log**. Every action, who did it, and why.

Nothing here can be edited or deleted by anybody. Not by staff, not by you, not by the tech team.

As an owner you see everything, including what the other owners did. The screen says so at the top: *“You are seeing every action by everyone, including the other owners.”*

This is the answer to any argument about who did what. Search by person, by action, or by reason.

PART 10

Other things you can do

10.1 Staff and who can see what

Menu: **Admin → Team Access**.

To add somebody

1. Click **Invite**.
2. Type their name, email and choose their role.
3. Click **Send invitation**.

They get a link and set their own password. **You never see their password.**

To remove somebody

Click the small person-with-a-cross icon on their row, type why, and confirm.

Their account is switched off, not deleted. Their past actions stay in the audit log with their name on them. That is deliberate — history must stay readable.

> **You cannot remove an owner**
>
> The remove icon never appears on an owner's row, and you cannot remove yourself.
>
> This stops the business being locked out of its own CRM by one angry afternoon.

10.2 Sending email

Menu: **Marketing → Email Composer**.

1. Choose who it goes to: **all agencies**, **all sellers**, **all users**, or one **person**.
2. The CRM counts the recipients and shows you the number before you send.
3. Write a subject and a message. You can attach files.
4. Type why you are sending it. This is compulsory and is saved.
5. For a large send, type the recipient number in the confirmation box.
6. Click **Send**.

Emails are landing in spam right now

Everything Zipper sends currently goes to people's spam folder. This is not a fault in the CRM.

It is because we send from a **gmail.com** address. Email systems around the world distrust that.

The fix is to buy a proper domain name for the business. Until then, assume anything you email may not be read, and follow up by phone or WhatsApp for anything important.

10.3 Live monitor

Menu: **Live & Comms → Live Monitor**. Every room that is live right now.

Rooms that look unusual are lifted to the top under **Needs a look** — either gifts arriving much faster than normal for that host, or a very large number of viewers.

Four buttons on each room: **Warn**, **Ban**, **Mute**, **End**. All four need a reason and all four are recorded against your name.

Banning and ending are different things

Ban stops the account. It does **not** close the room. If the stream needs to stop now, end it as well.

End closes the room. It does **not** ban the account.

Moderation does not need a signature. It happens immediately. Only money goes through the five steps.

10.4 The approvals queue

Menu: **Admin → Approvals**. This screen is **owners only**.

When a staff member wants to do something above their level — create an agency, add a host, change a setting — it waits here for you.

Approve or reject each one. Rejecting needs a reason.

PART 11

Six traps — read this part twice

These are the six things that have caused real confusion. Every owner should know all six by heart.

11.1 Approved is not paid

Signing a card does not move money. The card sits in **Approved** until somebody executes it.

Orange strips across the CRM tell you when this has been forgotten: **“N payouts were signed and never executed.”**

Check for those strips every week. Each one is a promise made and not kept.

11.2 A dash is not a zero

If the CRM cannot read something, it shows **—** and says so. It never shows a made-up **0**.

This is deliberate, and the reason is worth understanding: nobody double-checks a zero. A wrong zero looks like good news and gets believed. A dash makes you ask.

So: a dash means **“we do not know”**. A zero means **“we looked, and it is nothing”**. Treat them completely differently.

11.3 The profit figure is not real profit yet

> **This one matters more than the rest**
>
> The weekly report says, in red: **“This profit is an upper bound.”**
>
> That means the figure shown is the **best possible case**. Your real profit is **lower**.
>
> It is lower because the cost of running the company has not been subtracted — staff salaries, servers, marketing, payment gateway fees, taxes, refunds.
>
> None of those have been entered, so none of them could be taken off.

The reason is simple: **there is no screen in the CRM for entering costs.** The system underneath is ready for it, but the screen was never built.

Until that screen exists, the honest way to read the profit figure is: *“this is what we made before paying for anything.”*

Do not show that number to an investor, a bank or a partner as profit without saying that sentence with it.

11.4 The Dashboard profit box is misleading

> **Do not trust the NET PROFIT box on the Dashboard**
>
> The main Dashboard has a box labelled **NET PROFIT** with a margin percentage next to it.
>
> That box takes revenue and subtracts host payouts. **Nothing else.**
>
> It carries no warning at all, so it looks like a finished answer. It is not.
>
> **The only screen that tells you the truth about profit is the Weekly Report.** Use that one.

11.5 The same payment reference twice

A UTR is meant to be used once. If the same one appears on two different purchases, it may mean we are crediting stock for money we only received once.

The CRM checks and warns you in red. Never sign past that warning without opening the bank statement yourself.

11.6 Nothing can be undone

There is no undo anywhere in this CRM. Not for executing a card, not for rejecting one, not for banning a host.

Every correction is a **new** card, which has to be checked and signed like any other.

This is not a limitation to work around. It is what makes the record trustworthy. A record that can be quietly changed is not a record.

PART 12

Your routine

12.1 Every day — about five minutes

1. Sign in.
2. Open **Waiting on you**.
3. If **To sign** has a number, go to the **Money Board** and deal with each card.
4. After signing, execute anything that needs it — or make sure somebody does.
5. Look for orange strips anywhere on the screen. They are the CRM asking for your attention.

12.2 Every Monday — about twenty minutes

1. Open the **Weekly Report** for the week that just closed.
2. Read the profit and loss section, remembering Part 11.
3. Check the agencies section — who is earning, who is below the floor.
4. Open **Finance → Payouts** and look for anything signed but not paid.
5. Open **Finance → Liabilities** and check the net position.
6. Open **Alerts** and read anything new.
7. Open **Sellers & Agencies → KYC** and clear anything older than three days.

12.3 Every month

1. Open the **Audit Log** and read through the money actions. You are looking for anything you do not recognise.
2. Open **Credit Book** and chase every overdue seller.
3. Check **Team Access** — is everybody on that list still working here?

12.4 When something looks wrong

Ask these questions, in this order

Is it a dash instead of a number? Then the CRM could not read it. Click Refresh. If it stays, tell the tech team.

Is a payment stuck? Look at which column the card is in. *Approved* means somebody still needs to execute it. *Failed* means the transfer did not work and needs a person.

Did somebody do something you did not expect? Open the **Audit Log** and search their name. Every action has a reason attached.

Does a figure look wrong? Export the CSV and check the individual rows. The export is produced by the same code as the screen, so they can never disagree.

Still stuck? Do not approve anything you do not understand. A payment delayed by a day costs very little. A payment made wrongly cannot be taken back.

PART 13

What is not finished yet

Be honest with each other about these. They are known, and none of them is a fault in what has been built.

What	What it means for you
The third owner is not set up	Only two owner accounts exist. With two, one of you being away can stop payments. This should be fixed first.
There is no screen for entering costs	This is why profit reads as an upper bound. Until it is built, you do not have a true profit figure.
Emails go to spam	Because we send from a gmail.com address. Needs a proper business domain name. Follow up important emails by phone.
Chance games are built but switched off	All the controls exist. Before switching them on, get advice from an Indian lawyer who knows the online gaming rules that came into force in May 2026.
Virtual account numbers are ready but off	These would let each seller pay into their own account number, removing UTR typing. Needs a business bank account first.
The Android app is next	The CRM and the system behind it are finished. The app comes after.

> **The short version, if you remember nothing else**
>
> **1.** Check **Waiting on you** every day.
>
> **2.** Never sign something you do not understand.
>
> **3. Approved is not paid.** Someone must execute it.
>
> **4.** A dash means unknown. A zero means nothing. They are different.
>
> **5.** The profit figure is not real profit until costs are entered.
>
> **6.** Nothing can be undone. Take three more seconds.
